

## **New Features**

Here we summarize the new features in version 5 of PDF Converter Professional in three sub-topics: creating, unlocking and editing PDF files. See also Key Features.

### **New features in PDF creation**

#### **New input and output file formats**

PDF Create! 5 is able to load XPS, PS and EPS files and create PDF files from them. PDF 1.7 output is supported.

#### **Handling PDF packages**

PDF packages help you group related files, maybe of differing file types, making it easier to handle them e.g. send them by e-mail. A PDF package is a single PDF 1.7 file that contains a set of PDF files created from the input files.

#### **Archiving mails, attachments and other Outlook items**

It is possible to archive selected Microsoft Outlook items or an entire Outlook folder with or without subfolders. Different archiving methods are available. Outlook items can be stored in separate PDF files, merged into one PDF file or transferred to a PDF package.

#### **New profiles for creating PDF files**

With the Searchable PDF profile Searchable PDF files can be created from image files or Image-only PDF files using OCR for extracting text from images.

The PDF with MRC Compression profile is useful for creating compressed PDF files from documents scanned to image files. It has most value for documents with grayscale or color pictures or backgrounds. You can choose how to balance image quality against file size.

Creation of Searchable MRC PDF with the combination of both features is also possible.

#### ***In the Enterprise Version***

#### **Support for Livelink® ECM - Enterprise Server 9.7.0.**

Besides Hummingbird Enterprise, Interwoven WorkSite and Hummingbird DOCSSOpen, a fourth Document Management System, LiveLink ECM from OpenText Corporation is also supported.

## **Enhanced functionality**

In Hummingbird Enterprise and Interwoven WorkSite, the integration of the client applications allows PDF files to be created directly from a Document Management System.

## **New features in unlocking PDF files**

### **XPS input**

This product is able to load XPS files and convert them to editable formats. It performs a uniform processing mechanism for both XPS and PDF files. XPS files are handled in their native format. No other software component is required for the conversions.

### **Converting to Office 2007 file formats**

On Windows Vista and Windows XP with installed .NET Framework, the program generates .DOCX, .XLSX and .PPTX format files. The conversion can be performed without having Office 2007 installed on the computer. Earlier versions of MS Office applications are able to open these new types of file format if the MS Office Compatibility Pack is installed.

### ***In the Enterprise Version***

Support for Livelink® ECM - Enterprise Server 9.7.0.

## **New PDF editing features**

### **Improved performance**

Launching and displaying pages are speeded up, font handling is more versatile and document printing has been made more robust.

### **Enhanced document mark-up**

Callouts are introduced to allow text box comments to be linked by an arrow to a precise text location. More styling is supported in comment texts. The Comments panel offers new revision tools to better monitor document changes. Comment review and migration status can be set, comments can be sorted, selected, summarized and exported. Comment replies and conversations are handled more comprehensively.

### **PDF document comparison, splitting, extraction and imposition**

Compare two versions of a PDF document to quickly pin-point changed text or objects. Split a large PDF into smaller ones by given criteria, to make it easier to distribute.

Extract certain pages from a PDF according to criteria you define. Use imposition to prepare a PDF for submission to a printing house.

### **Table of Contents**

Insert a Table of Contents into a PDF, based on the bookmark hierarchy. This provides navigation when the document is printed and bookmarks are no longer available.

### **Stamps and watermarks**

New stamps are offered and custom stamps can be created – even including dynamic elements. A transparency setting can be applied to images, stamps or watermarks.

### **Windows Desktop Search (WDS)**

PDF Converter Professional 5 augments the WDS operating system search facility, so it can also search text in PDF files – even image-only files.

### **Measurement Tools**

Distance, perimeter and area tools are available for on-screen measuring. When the PDF contains a scale drawing, you can enter its scaling so these tools show the distances or areas represented inside the drawing.

### **Include and handle 3D objects**

Three-dimensional objects can be rotated, spun, panned, zoomed and viewed from different perspectives. Animations in the object can be played and the measurement tools can be used with 3D objects. The program allows you to embed 3D objects in PDF files. You can view, modify and export the model tree that defines the object structure.

### **Improvements in Text-to-Speech**

Nuance RealSpeak Solo is offered for nine languages, compared to just one previously. You can now have PDF text read aloud paragraph-by-paragraph, not just page-by-page.

### **Movie and audio files**

You can embed movie and sound files in the PDF and control how they will be played.

### **Extended tagging**

Tags can now be applied to individual objects in the document.

## **Packages and Envelopes**

PDF packages can be opened and the individual PDF files and their attachments can be accessed and saved individually. New attachments can be added to PDF files inside a package. Files can be grouped inside packages as PDF files or in envelopes in their original file types.

## **PDF Security**

Security set-up is streamlined, with support for custom signature and security schemes. Digital signatures can now be automatically time stamped.

### ***In the Enterprise Version***

## **Document Management System support**

DMS client side integration is provided for Hummingbird and iManage. LiveLink ECM from OpenText Corporation is also supported. An automation API for system integration is offered.

## **Redacting and document inspection**

Sensitive words or objects in PDF files can be blacked out so they are neither readable nor searchable. This redaction can be done by manual selection or searching defined texts. Document inspection allows removal of comments, attachments, document properties etc, which may include confidential information.

## **Other legal innovations**

Support is introduced for the CaseMap legal storage system and for Bates stamping – automatically assigning unique identifiers to pages in a set of documents. New legal stamps and clipart are provided.
